

Core Experience Improvements

1. Multi-format export, not just Excel

- CSV, Google Sheets (direct API push), PDF, JSON
- Different users have different workflows — locking them into just `.xlsx` limits your market

2. Editable preview before export

- Show extracted data in an editable table (like a spreadsheet UI) before generating the final file
- Lets users fix any Gemini mistakes without redoing the whole process — this alone massively increases trust

3. Drag-and-drop batch upload

- Let users drop 10, 50, 100 images at once instead of one-by-one
- Show a progress bar / live status ("Processing image 12 of 50...")

4. Template/schema builder

- Let users define their own fields (not hardcoded "name, date, amount") — e.g., invoices need different fields than business cards or ID cards
- This turns your app from "one-use-case tool" into a flexible platform

Trust & Reliability Features

5. Confidence indicators

- Flag fields Gemini wasn't confident about (e.g., highlight in yellow) so users know what to double-check
- Builds trust — users won't blindly trust 100% automation

6. Side-by-side image + extracted data view

- Show the original image next to the extracted row so users can visually verify accuracy instantly

7. Retry / re-scan button

- One-click re-attempt on a specific image if extraction failed or was inaccurate

Business-Oriented Features

8. Use-case templates

- Pre-built extraction templates: "Receipts," "Business Cards," "Invoices," "ID Documents," "Handwritten Notes"
- Non-technical users don't want to write prompts — they want to pick a category and go

9. History / saved projects

- Let users revisit past batches, re-download files, or continue an interrupted session

10. Team/multi-user support

- Shared workspace, especially valuable for small businesses processing receipts/invoices as a team

Differentiation / "Wow factor" Features

11. Auto-categorization

- Beyond just extracting fields, auto-tag documents by type (e.g., automatically detect "this is a receipt" vs "this is a business card")

12. Currency/language auto-detection

- Especially useful for receipts from different countries — auto-detect and normalize currency/date formats

13. Integration with existing tools

- Direct export to Google Sheets, QuickBooks, Zapier, or Airtable — removes a manual step users currently have to do themselves

14. Mobile camera capture

- Built-in camera capture (not just file upload) — huge for receipt/invoice use cases where people photograph on the spot

Monetization-Friendly Features (if you plan to charge)

15. Free tier + paid tier

- Free: limited images/month (mirrors what we discussed with Gemini's own free tier)
- Paid: higher volume, faster processing (using Gemini Pro instead of Flash-Lite), priority support

16. Usage dashboard

- Show users how many images they've processed, remaining quota, and cost savings vs manual data entry — this reinforces value

My honest prioritization if you're building solo:

Start with **#2 (editable preview)**, **#5 (confidence indicators)**, and **#8 (use-case templates)** — these three directly address the biggest fear people have with AI extraction tools: *"can I trust this without checking everything manually?"* Once that trust is established, batch processing and integrations become the natural next layer.

Want help wireframing the UI flow for the editable preview + confidence indicator feature?
